

Editorial

The Acta Biológica Catarinense Journal, from the Department of Biological Sciences and the Environmental Sciences Research Program of the University of the Joinville Region (Univille), presents to the academic and scientific community the second issue of 2026.

ABC is under the responsibility of its own permanent Editorial Committee, formed by Univille faculty and external members.

Its main objective is the publication of original articles in all relevant areas of Biological Sciences focused on studies about the environment and biodiversity, including Aquaculture, Bioarchaeology, Biogeography, Conservation Biology, Molecular Biology, Botany, Ecology, Ecotoxicology, Environmental Education, Ethology, Evolution, Phycology, Conservation Genetics, Limnology, Lichenology, Mycology, Environmental Microbiology, Paleontology and Zoology. It also has a section dedicated to articles on Biology Teaching.

This issue features nine original articles, the result of research conducted at various institutions in Brazil. The articles presented cover the following themes: ecological relationships of fauna, avifauna, ethology of bees, ethology of primates, flora restoration, wasp diversity, animal morphology, plant genetics, and landscape analysis.

We hope that the trust placed in our journal, as yet another national vehicle for the socialization of scientific knowledge, will be renewed at every moment, enabling the dissemination of other important studies that expand the knowledge produced by academia on the national biological heritage and its multiple interfaces.
